

Great Lakes

CUSTOM CAPABILITIES

PRODUCT PROFILE...

This application from our BS2 line of products, showcasing a customized version of our SENTRY™ Console System.

As part of its transition to digital transmission, WQLN TV wanted to create a new “Master Control” center which could manage the station’s broadcast operations from a single site and also be viewed by visitors to the station. As part of some station renovations, a room was chosen with large window observation from the station’s main hallway. Great Lakes was asked to meet several challenges, to include rack mounting of equipment both above and below the work surface, as well as the integration of flat panel monitors, mounted directly to the work station.

These requirements were perfect for Great Lakes’ SENTRY™ Console System. Great Lakes was able to sit with the engineers at WQLN, learn about their needs and then to easily construct a console system which provided the rack mounting desired, along with ease of installation, networking and powering of the equipment.

SENTRY’s unique design allowed for a simple, yet stylish control center which will meet the station’s need for years to come. From a basic layout, Great Lakes was able to provide WQLN with a custom control center, designed to meet the station’s unique and specific needs in the same time frame and for about the same cost as the station would have incurred for “off the shelf” broadcast furniture which would have offered much less flexibility in design and installation.
